If the code does not clear, turn off the circuit breaker or unplug the oven for five minutes, and then restore the power. Error codes on ovens with electronic displays help to narrow the problem, but the first step in diagnosis is clearing the logic board and error code. In some cases, this is the only repair needed. However, if the code reappears, the owner should have a professional repair the unit. If the error code indicates a problem with the door lock, clearing the code does not always resolve the issue immediately. Manufacturers design the door lock to remain in the locked position until the oven has time to cool after cleaning. Once it reaches the set temperature, door locks disengage again. Prior to solid-state appliances, the oven owners had the ability to purchase parts and replace them until the oven worked correctly. While the error codes help to narrow the problem, they are often ambiguous. The same code can indicate a failure of the keypad or the clock unit, both of which are expensive enough that a service call would likely be the most economical option. More From Reference. Clear error code and run a Cleaning Cycle to verify problem. One of the main relays is not working properly. Motor Control Unit MCU has an internal malfunction, repeating under or over voltage, or over current conditions. The use of analog pressure sensor or digital pressure switch is model dependent, but the procedure to detect this error does not change. Check connections from tub to air trap, air trap to pressure hose, and pressure hose to pressure sensor. This code is generated if the door has not been open for 3 consecutive cycles, or the door switch is open while the door is locked for more than 5 seconds. The overflow condition occurs if there is too much water or foam in the washer and the overflow contact on the pressure switch is closed for more than 2 minutes, 30 seconds or 5 times during the same cycle. If overflow occurs, the valves are closed and the drain pump switches on for at least 30 seconds. If less than 0. If the drain time exceeds 8 minutes without reaching reset level in pressure sensor, the valves are turned off and the drain pump will stop running. Washer drains for 4 minutes, pauses 5 minutes, then tries again for 4 additional minutes of draining. The control is unable to properly detect motor speed and the machine will shut down. If a failure occurs during high-speed spin, the door will be unlocked after three minutes. The main control has detected a short in the motor control unit. If the Overflow contact on the pressure switch is closed for more than 60 seconds, an Overflow condition will occur. Turn off hot and cold water faucets and unplug the unit before servicing. If there is an error reading this data it will cause this error. If the MCU detects multiple resets or errors during a wash cycle it will go into this error mode. A Door Unlock Error occurs if the door cannot be unlocked. It will try to unlock the door 6 times before displaying the error code. A Door Lock Error occurs if the door cannot be locked. It will try to lock it six times before displaying the error code. The motor control unit senses a suds lock condition by analyzing the current draw on the drive motor. This may signify a bad pump, an extra heavy load, excessive detergent, or excessive suds.
